Series Number: III

Number of Pages: 286

Abstract: This publication is one of a series of reports presenting
socio-economic data for small areas within Maryland. Tables
and maps pertaining to the income distribution of families
and unrelated individuals derived from the 1970 Census of
Population and Housing make up a major portion of the report.

The report provides basic data for election districts and
places with a population of 2,500 persons or more in 1970.
The two aspects of income distribution considered are income
levels and source, and poverty status. Information regard-
ing median income and poverty status of unrelated persons is
also provided. Selected indicators were mapped by region at
the election district level.

This report was developed to provide information regarding
the income distribution and poverty status in Maryland and
to provide one input into an integrated set of socio-economic
data for small areas in Maryland. It is hoped that this data
will assist in creating a comprehensive State data base, and
in problem identification and program planning at the local,
county and regional level.

SECRETARY OF STATE PLANNING
MADELINE L. SCHUSTER
DEPUTY SECRETARY

April 15, 1974

The Honorable Marvin Mandel
Governor of Maryland
State House
Annapolis, Maryland 21404

Dear Governor Mandel:

I am pleased to transmit herewith the report entitled "Maryland 1970 Social Indicator Series, Volume III: Income Characteristics". This report is the third in a series designed to provide information of analytical significance on the socio-economic status of the population in Maryland by small areas.

Based upon information retrieved from the 1970 Census of Population and Housing regarding income sources, income levels and the poverty status of persons residing in Maryland, it is anticipated that the report will be useful in program planning at the local, county and regional levels.

Copies of the report are being distributed to interested agencies and individuals throughout the State.

Sincerely,

Vladimir Wahbe
Vladimir Wahbe

Enclosure

I. INCOME CHARACTERISTICS

The purpose of this report is to provide a series of statistics that can be used to describe the economic status of Maryland's population for small areas. Most of the data included in the report refer to families. This reflects the fact that, according to the 1970 Census, approximately 90 percent of Maryland's population lived in families. Data regarding the poverty status of unrelated persons are also presented, since a large proportion of all unrelated persons were below the poverty level.

The indicators used were chosen to assist in small area problem identification. In addition to detailing income source, the data were manipulated to determine percent of families with incomes above and below a predetermined average income range. Additional data referring to income structure relative to the poverty level are also provided in order to identify areas with income structures that vary significantly from the remainder of the State, region or county.

Statistics tabulated for the white and nonwhite sectors of the population at the minor civil division or place level (for areas outside the two metropolitan regions and Southern Maryland Region) should be interpreted with some caution. The small size of the resident population that is classified as nonwhite makes comparisons of relative data with data for the white sector difficult.

II. DESCRIPTION OF INCOME CHARACTERISTICS

Census definitions of the concepts used in this report are contained in a later section entitled "Definitions". It is recommended that users of the data study that section carefully before using the data.

Income Source

Census information pertaining to family income was obtained from a 20 percent sample of 1970 Census questionnaires. The income source is detailed only for the family unit, and refers to 1969 reported income. Since income can accrue from more than one source, the sum for the individual sources does not equal one hundred percent. The breakdown of income by source is useful in relating poverty status to causal factors, and in identifying areas which exhibit an income distribution which varies significantly from the rest of the State.

Family Income Level

Income data is displayed in two ways. The percent of persons with income under \$4,000, over \$10,000 and over \$15,000 is provided to show concentrations of persons with extremely low and high income levels. The median income for an area is the amount that divides the total number of families, or unrelated persons, into two equal groups, half having incomes above the median value and half having incomes below the median value. Median income values were calculated using linear interpolation of the original income categories. Median values are a useful, but rough, measure which can facilitate analysis of local performance with respect to several related variables, such as age, education and income.

Poverty Status

The poverty level used by the Bureau of the Census is determined by several criteria including income, family size and urban versus rural residence. The poverty thresholds, or minimum income level required to be classified as being above the poverty level, are shown in the following table.

1969 Poverty Level Thresholds, by Size of Family
and Sex of Head, by Farm and Nonfarm Residence¹

Size of family	Total	Nonfarm			Farm		
		Total	Male head	Female head	Total	Male head	Female head
All unrelated individuals..	\$1,834	\$1,840	\$1,923	\$1,792	\$1,569	\$1,607	\$1,512
Under 65 years.....	1,888	1,893	1,974	1,826	1,641	1,678	1,552
65 years and over.....	1,749	1,757	1,773	1,751	1,498	1,508	1,487
All families.....	3,388	3,410	3,451	3,082	2,954	2,965	2,757
2 persons.....	2,364	2,383	2,394	2,320	2,012	2,017	1,931
Head under 65 years.....	2,441	2,458	2,473	2,373	2,093	2,100	1,984
Head 65 years and over..	2,194	2,215	2,217	2,202	1,882	1,883	1,861
3 persons.....	2,905	2,924	2,937	2,830	2,480	2,485	2,395
4 persons.....	3,721	3,743	3,745	3,725	3,195	3,197	3,159
5 persons.....	4,386	4,415	4,418	4,377	3,769	3,770	3,761
6 persons.....	4,921	4,958	4,962	4,917	4,244	4,245	4,205
7 or more persons.....	6,034	6,101	6,116	5,952	5,182	5,185	5,129

Two measures of poverty status are contained in the report. The first measure describes the number of families and unrelated individuals below the poverty level in both absolute and relative terms. The percent of families below the poverty level with children under 18 has been specifically singled out as a social indicator, since special attention has been devoted to providing services to low income families with children. Unrelated individuals,²

¹ U.S. Bureau of the Census, Census of Population: 1970 GENERAL SOCIAL AND ECONOMIC CHARACTERISTICS. Final Report PC(1). App-30.

² Armed forces personnel living in barracks and college students in dormitories, as well as inmates of institutions, are excluded from poverty level tabulations.

persons living alone or living with nonrelatives, are of particular interest, since for the State as a whole, the percent of unrelated individuals below the poverty level is five times greater than the percent of families.

The second measure of poverty status included in the report pertains to the ratio of family income to the poverty level. The measure differs from tabulation of family income in that it takes family size, age of family head and urban-rural location into consideration. The ratio is calculated by dividing family income by the appropriate poverty threshold. For example, if two nonfarm families, one a two person family with the family head over 65 and the other a six person family, their relationship to the poverty level can differ markedly. If we assume that each family has a male head and an income of \$4,950, the ratio is approximately 2.0 in the first case and 1.0 in the second case.

III. REVIEW OF STATISTICS

The attributes of income chosen for inclusion were limited in scope by the set of questions asked in the 1970 Census. Nevertheless, the social indicators pertaining to income contained in this report represent paths of inquiry into a number of topics ranging from source of income patterns to the distribution of wealth and poverty in Maryland.

The mapping of selected indicators underscores the differences in income characteristics over relatively short distances.³ Moreover, the use of maps can give the reader additional insights into socioeconomic problems as evidenced by clustering, isolation and coincidence with spatial patterns of other social indicators such as educational level or occupational status.

It should be emphasized that studies using the data contained in this report will also benefit from an examination of compatible data found in other reports of this series. A more systematic approach to the understanding of interrelationships among socioeconomic variables will enable researchers to more accurately deal with complex problems.

A. Family Income

The following observations highlight some of the more obvious aspects of Maryland's income distribution.

1. The average family size in Maryland is larger for the nonwhite population than for the white population and larger for rural families than for urban families. However, the average family sizes in the more rural regions, Western Maryland and the two Eastern Shore regions, are

³ The initial program to generate computer maps was provided by Dr. David Cowen and Dr. Paul Lovingood, Department of Geography, University of South Carolina.

lower than for the urban regions. This is partially due to differences in age structure. A higher proportion of persons in these three regions are over 45, which indicates a larger number of older families with fewer dependent offspring. This also is reflected in the lower proportion of families below the poverty level which include children under 18 in these regions. Average family size differences can be a useful indicator of relative buying power and also can be related to labor force participation rates, by race and geographical area.

2. The main source of family income is from wages and salaries. Of the remaining sources, social security or railroad retirement income has a geographical distribution which supports the observations in the previous paragraph. A higher proportion of the population in Western Maryland and the two Eastern Shore regions receive income from this source, and a lower proportion receive income from wages and salaries. These regions also have a high proportion of families and unrelated individuals below the poverty level. Studies of these characteristics at the local level would be useful in identifying and analyzing welfare problems.

3. Differences in income source by race are also evident. A larger proportion of nonwhite families receive income from wages and salaries and public assistance or welfare sources, but fewer receive income from other sources. This again reflects the much higher proportion of nonwhite families and unrelated persons that are below the poverty level.

4. Over half of the families in Maryland receive over ten thousand dollars in income. On a regional basis, however, only the two metropolitan regions show an equivalent performance, with the adjacent regions, Frederick and Southern Maryland, having over forty-five percent of their population in these categories. Median incomes show a similar distribu-

tion. The relatively high level of well-being of most of the population, particularly within the metropolitan areas, indicates geographical differences in purchasing power. This information can be utilized in the analysis of income disparities and its significance for taxation, welfare and commercial development.

5. Differences in nonwhite income distributions provide another dimension for studies of income structure. A much higher proportion of nonwhite families than white families have incomes under \$4,000. Only the Washington Suburban Region had less than twenty-four percent of the nonwhite families below this level. Median income levels were similarly much lower for nonwhite than for the white families. This data is useful in comparing interracial differences in income level, by area.

B. Poverty Status

Several significant observations regarding poverty status are discussed in the previous section. A few additional points will be made below.

1. There is a higher proportion of unrelated persons than families with incomes below the poverty level. This relationship is particularly significant for the nonwhite population, as over forty percent of the unrelated persons and twenty percent of the families have incomes below poverty level. Of these families, fifty-seven percent are headed by females.⁴ Further analysis of this data at the local level will aid welfare-oriented studies interested in locating pockets of poverty and detailing racial and family characteristics of persons below the poverty level.

2. Area differences also exist in the number of persons below the

⁴ Calculation based on data in U.S. Department of Commerce, 1970 CENSUS OF POPULATION, GENERAL SOCIAL AND ECONOMIC CHARACTERISTICS: Maryland, PC (1)-C22, Table 58, p. 22-160.

poverty level. There is a lower proportion of poor families and unrelated persons in the two metropolitan regions than in the rest of the State. However, Baltimore City showed a high proportion of the population below the poverty level, particularly for the nonwhite population.

3. The ratio of family income to the poverty level is a useful indicator of the geographical distribution of purchasing power, adjusted to account for differences in family size. These data provide further detail regarding the degree of disparity between low and high income groups, as well as further detail regarding the extent of poverty. For example, whether families below the poverty level are near the poverty threshold, or significantly below it. Income inequities for areas are readily pinpointed, which is useful in comparing economic well being and relative poverty status for small areas, counties or regions. This, again, is useful for studies to determine the need for interregional transfer payments or other ameliorating measures.

IV. SUMMARY

The structure of Maryland's income distribution varies considerably by region and race. Locational factors play a significant role in determining the proportion of the local population which have a particularly high or particularly low income.

Regional differences in income structure are evident. The Western Maryland and Eastern Shore regions have lower median income levels than the remainder of Maryland and higher proportions of the population with incomes below poverty levels. Although the population size in these areas is smaller than in the more urbanized regions, the data still indicates that poverty is a significant problem in these areas. A similar situation, but of much greater magnitude, exists in Baltimore City. The discrepancy between the performance of these areas and the remainder of Maryland is a subject for further research.

The data contained in this report make a significant contribution to the body of socioeconomic data available by small areas for Maryland. While the data itself is useful in studies related to local welfare problems, it is probably more significant when used in conjunction with the small area data included in the other reports of this series. The interrelationships between these statistics can present a detailed picture of local socioeconomic status. This can help identify areas with chronic problems which require further public program support.

V. GUIDE TO USING THE DATA

The county level data are ordered alphabetically by region. The statistics for minor civil divisions (MCD's), election districts in Maryland, are additive to the county totals. Data for urban places are presented separately, as MCD boundaries cannot always be equated with those of a defined urban center. In some cases the county total derived from adding the MCD data differs slightly from the total given on the State summary tables. In these instances full data disclosure is not presented at the MCD level in order to insure confidentiality of responses in areas where there were very few individual responses from specific population groups. This may occur in sparsely populated areas or areas with a very small non-white population. In such cases, a minus one (-1) in the data at the MCD level may indicate such suppression of data.

Unincorporated centers are indicated by the letter "U" in parenthesis after the place name. In cases where an urban place extends into two counties, the term "part", in parentheses, has been added after the place name.

The accompanying maps can be used to assist in interpreting the MCD data for county, regional, or even State perspective. The degree of differentiation or homogeneity between contiguous areas with respect to a single or several indicators can be observed readily using the mapping technique. For example, the existence of a Baltimore-Washington corridor of high performance in certain indicators can be readily observed using the mapping technique.

The maps can be used to identify areas which exhibit unusual performance with respect to a particular indicator. Overriding factors such as population density or accessibility to urban areas can thus be detected.

Urban-rural patterns of performance can be readily observed, which aid in the analysis of the data as presented in tabular form.

The maps provided in this report are only a selection of what were considered the more significant attributes. In the Income Characteristics report, all mapped indicators can be derived directly from the tables presented in the report. The user is thus able to consider the actual value of a certain attribute for a specified area, and the relative performance of that area with respect to a defined range of values.

VI. DEFINITIONS⁵Geographic Areas

Minor Civil Divisions--These are the primary political and administrative subdivisions of a county. Note: In Maryland, it corresponds to an election district.

Population Census Concepts

Urban-rural residence--This is one of the most important breakdowns of the population by geographic residence. Geographic areas are classified as urban or rural on the basis of their population size or density at the time of the census.

1. Urban population--Generally, all persons residing in areas determined to be urbanized areas or in places of 2,500 or more outside urbanized areas. A common breakdown of the urban population is given below.

i) Population in central cities of urbanized areas.

ii) Population in urban fringe of urbanized areas.

Population in urbanized areas but not in central city.

iii) Other urban population outside urbanized areas.

Population in places of 2,500 or more outside urbanized areas.

2. Rural population--Population not classified as urban constitutes the rural population.

Race--This refers to the division of the population into white, Negro, and several other racial categories. These racial categories do not correspond to strict scientific definitions of biological

⁵ Excerpted from the Census Users' Dictionary, U.S. Department of Commerce, 1970 CENSUS USERS' GUIDE, Part 1, 1970.

stock. Persons were asked to indicate their race by selecting one of the following: White; Negro or Black; Indian (American); Japanese; Chinese; Filipino; Hawaiian; Korean; Other (specify).

(In Alaska, Hawaiian and Korean were omitted and Aleut and Eskimo were added.)

Family/unrelated individual status--All persons enumerated are classified as family members, unrelated individuals, or inmates of institutions.

1. Family--Two or more persons living in same household who are related by blood, marriage, or adoption. (No families are recognized in group quarters.) All persons living in a household related to each other are regarded as one family. For instance, a son of the head and his wife living in the household are treated as part of the head's family.

The number of families does not necessarily equal the number of households, since not all households include families. Families are classified in the complete-count basic records by family size or number of persons in a family from 2 persons to 35 persons. Average number of persons per family is calculated.

2. Unrelated individual--Persons not living with relatives, but living in a household entirely alone or with one or more persons not related to him, or living in group quarters (excepting inmates of institutions).

Total income--Ascertained for all persons 14 years of age and over for the preceding calendar year, even if they had no income. Total income is the sum of the dollar amounts of money⁶ respondents reported receiving (best estimate if exact amount not known) as wages or salary income, net nonfarm and farm self-employment income, and other income, as specified below. In statistics on family income or household income, the combined incomes of all members of each family or household are treated as a single amount. For unrelated individual income and for income statistics of persons 14 years and over, the classification is by the amount of their own (individual) total income.

⁶ Receipts from the following sources were not included as income: money received from the sale of property, (unless the recipient was engaged in the business of selling such property); the value of income "in kind" such as food produced and consumed in the home or free living quarters; withdrawal of bank deposits; money borrowed; tax refunds; exchange of money between relatives living in the same household; gifts and lump-sum inheritances, insurance payments, and other types of lump-sum receipts. U.S. Department of Commerce, 1970 CENSUS OF POPULATION, GENERAL SOCIAL AND ECONOMIC CHARACTERISTICS: Maryland, PC(1)-C22 Md., pg. App-25.

Median incomes⁷ are calculated for families, unrelated individuals, and persons 14 years and over for total income and for each type of income.

Wage or salary income--Money respondents reported receiving as wages, salary, commissions, bonuses, or tips from all jobs (before deductions for taxes, bonds, dues, etc.). Respondents were to include sick leave pay, but exclude military bonuses, reimbursements for business expenses, and pay "in kind."

Self-employment income--Money respondents reported receiving as profits or fees (net income after business expenses) from their own business, professional practice, partnership, or farm. (If the enterprise lost money, respondents were to report the amount of loss.) In 1970, self-employment income from a farm (including earnings as a tenant farmer or sharecropper, excluding payment "in kind") was reported separately from other self-employment income.

Income other than earnings (other income)--Money respondents reported receiving from sources other than wages or salary and self-employment. Respondents were asked to specify other income as follows.

1. Income from social security or railroad retirement--This includes U.S. Government payments to retired persons, to dependents of deceased insured workers, or to disabled workers; excludes Medicare reimbursements.
2. Income from public assistance or welfare--This includes amounts received from Federal, State, and local public programs such as aid for dependent children, old-age assistance, general assistance, and aid to the blind or totally disabled. Excludes separate payments for hospital or other medical care.
3. Income from all other sources--This includes interest; dividends; veterans payments of all kinds; retirement pensions from private employers, unions, and governmental agencies; and other regular payments such as net rental income, unemployment insurance benefits, workmen's compensation, private welfare payments, alimony or child support, Armed Forces allotments and regular contributions from persons not members of the household. Excludes receipts from the sale of personal property, capital gains, lump-sum insurance or inheritance payments or payments "in kind".
4. Poverty level--In 1970, families and unrelated individuals (excluding college students in dormitories and Armed Forces personnel in barracks) are classified as being above or below the poverty level, using the poverty index adopted by a Federal Interagency Committee in 1969. This index takes into account such factors

⁷ The median income is the amount which divides the distribution into two equal groups, one having incomes above the median and the other having incomes below the median.

as family size, number of children, and farm-nonfarm residence, as well as the amount of money income. The poverty level is based on an "economy" food plan designed by the Department of Agriculture for "emergency or temporary use when funds are low". The definition assumes that a family is classified as poor if its total money income amounts to less than approximately three times the cost of the "economy" food plan. These cutoff levels are updated every year to reflect changes in the Consumer Price Index.

In 1970, percent below poverty level is calculated as the proportion of the total universe which reports income below the poverty level: for example, below poverty level families as a percent of all families.

Note: The data for this report excludes inmates of institutions, members of the Armed Forces living in barracks, college students living in dormitories, and unrelated individuals under 14 years old.

More detail regarding calculation of poverty level can be obtained from the report of the U.S. Bureau of the Census, Census of Population: 1970 GENERAL SOCIAL AND ECONOMIC CHARACTERISTICS, Final Report PC(1) App-30.
